

Securing Africa's Position in the Global Minerals Value Chain

The rising global demand for critical minerals and metals has placed Africa at the centre of the world's race to achieve net-zero emissions and transition to clean energy. The IEA estimates that the world will need to invest around USD 600 billion in mining by 2040 to fulfil governments' pledges to mitigate climate change. To achieve net-zero emissions, this amount will increase to almost USD 800 billion by 2050.
