

Transforming Africa’s Agribusiness: Growing Sustainable Food Systems for the Future

Africa’s agricultural story is often framed around its enormous productive potential. The continent has abundant land, diverse climates and a growing population that will drive demand for food for decades to come. Agriculture already contributes up to 20% of Africa’s GDP and employs more than 60% of its workforce. With food supply needs expected to triple by 2050 to meet rising demand, the opportunity is increasingly about more than producing more food. It is about building food systems that can turn agricultural production into higher-value products, jobs, investment and regional trade.
